

Before (v1.0.0–v1.2.9): vulnerable

Relation: $R_{\text{Mem}}(C, \epsilon)$

Public inputs: C, ϵ

Contract entry point:

```
update_commitment(  
  proof,  
  new_commitment  $\leftarrow$  free  
)
```

Anyone in the network path can swap new_commitment while keeping the proof valid.

After (v1.3.0+): SE-bound

Relation: $R_{\text{Upd}}(C_{\text{old}}, \epsilon_{\text{old}}, C_{\text{new}})$

Public inputs: $C_{\text{old}}, \epsilon_{\text{old}}, C_{\text{new}}$
(hashed per [9])

Contract entry point:

```
update_commitment(proof)  
 $C_{\text{new}}$  bound by IC
```

Simulation-extractable; no contract-controlled free parameter on this path.
